Launch

The RVX-SAT lets you inspect laterals from a mainline, ideal for finding dangerous gas line cross-bores and illicit flows. The system integrates with your existing ROVER X system components, reducing cost and equipment clutter. Best of all, RVX-SAT gives you the range and articulation to inspect where other lateral launch systems can’t.

total integration
RVX-SAT works with your existing ROVER X crawler reel and desktop controls, so upgrading couldn’t be easier or more affordable.

extended range
With its synchronized push reel, RVX-SAT travels to launch points as far as 500’ into a mainline, and then pushes 100’ into the adjoining lateral.

unique articulation
RVX-SAT’s auto-upright camera pans and tilts to capture superior detail. It also has twin LED lamp arrays and a sonde transmitter. (An axial camera is available.)

Crawl 500’ down lines 6” and larger.
Launch 100’ into laterals 4” and larger.
Avoid push rod damage with force-sensing rollers.
Pan 360 degrees and tilt 90 with auto-leveling camera.
Maneuver to troublesome launch points with steerable 6-wheel drive.
Rear-view camera assists navigation; multi-frequency sonde facilitates location.
